Problem Submissions Leaderboard Discussions Editorial

Given a double-precision number, **payment**, denoting an amount of money, use the NumberFormat class' getCurrencyInstance method to convert **payment** into the US, Indian, Chinese, and French currency formats. Then print the formatted values as follows:

```
US: formattedPayment
India: formattedPayment
China: formattedPayment
France: formattedPayment
```

where **formattedPayment** is **payment** formatted according to the appropriate Locale's currency.

Note: India does not have a built-in Locale, so you must construct one where the language is en (i.e., English).

Input Format

A single double-precision number denoting **payment**.

Constraints

- $0 \leq payment \leq 10^9$

Output Format

On the first line, print US: u where u is **payment** formatted for US currency.
On the second line, print India: i where i is **payment** formatted for Indian currency.
On the third line, print China: c where c is **payment** formatted for Chinese currency.
On the fourth line, print France: f, where f is **payment** formatted for French currency.

Sample Input

```
12324.134
```

Sample Output

```
US: $12,324.13
India: Rs.12,324.13
China: ¥12,324.13
France: 12 324,13 €
```

Explanation

Each line contains the value of **payment** formatted according to the four countries' respective currencies.
